

HR System — Testing Plan (2026-05-08 Update)

HR System — Testing Plan for 2026-05-08 Update

This is a focused checklist for the changes pushed in today's update — bug fixes + new features. Spend ~45 minutes running through it; tick each box as you confirm. Anything that doesn't match the expected behaviour goes in the bug list at the end.

URL: `https://hr.cloudxbloom.com` **Admin login:** `admin@pbhub.com` / `admin123` Other accounts: `bilal.sheikh@pbhub.com` (HR), `usman.tariq@pbhub.com` (Finance), `sara.khan@pbhub.com` (Manager), `hamza.iqbal@pbhub.com` (Employee). Password for all non-admin: `password123`.

Part A — Bug fixes (regression tests)

These were broken in your previous round of feedback. Confirm they're fixed.

A1. Attendance from admin shows in records

Logged in as: Bilal (HR).

Sidebar → **Attendance** → **Corrections**.

Approve a pending correction request (or get an employee to submit one first as `hamza.iqbal@pbhub.com`, then approve).

Sidebar → **Attendance** → **Daily Summary**, set the date range to include that day.

Expected: the corrected attendance shows up for that employee on that date.

Was: missing entirely (off-by-one date).

A2. Location permission on check-in

Logged in as: Hamza.

Click the floating button (bottom-right) → **Check in**.

Browser asks for location. Click **Allow**.

Expected: toast says "Recorded at HH:MM with location."

Refresh + try once more, this time clicking **Block** on the location prompt.

Expected: toast says “Location blocked — click the lock icon in the address bar to enable” instead of just “not shared”.

A3. Floating widget refreshes /attendance page

Logged in as: Hamza.

Open <https://hr.cloudxbloom.com/attendance> in **one tab** — note the status pill (probably “Not started”).

In a **second tab**, open the dashboard. Click the floating button → **Check in**.

Switch back to the first tab (don’t refresh).

Expected: within a second the status flips to “Working” with start time, no manual reload needed.

A4. Attendance heatmap updates

Logged in as: Bilal or Super Admin.

Sidebar → **Dashboard**. Scroll to the **Attendance heatmap** card.

Expected: today’s cell (and other days where employees checked in) is coloured. Empty days are grey.

Was: entire heatmap was grey because of a date-key bug.

A5. Currency shows PKR everywhere

Open </payroll/payslips/my> (any employee with payslips). **Expected:** “PKR 150,000” formatting.

Open </expenses/claims>. **Expected:** PKR everywhere.

Download a payslip PDF ([/payroll/payslips/my/\[cycleId\]](/payroll/payslips/my/[cycleId]) → Download PDF). **Expected:** all amounts prefixed with “PKR”.

Was: dollar signs.

A6. Logout button is visible

Logged in as: anyone.

Look at the bottom of the sidebar (left).

Expected: a clear pill button labelled “**Log out**” with a door icon — NOT just an icon.

Click it → you land on </login>.

A7. Browser tab title shows the org’s brand name

Open any protected page (e.g. </employees>).

Look at your browser tab.

Expected: “Employees · HR System” (or whatever the active org’s brand name is set to in Branding settings).

Was: hardcoded “Employees · PbHub” everywhere.

A8. Excel export buttons

`/attendance/daily` (as Bilal): pick a date range, click **Export to Excel**. A `.xlsx` file downloads. Open it — columns should be Date, Employee, Status, First In, Last Out, Worked, Late, Overtime.

`/expenses/claims` : **Export to Excel** in the page header. Confirm a workable spreadsheet downloads.

`/employees` (as Bilal): tick a few rows → sticky bar appears with **Export to Excel + CSV + Clear**. Both exports should produce a file containing the selected rows.

`/payroll/payslips/my` (as any employee): click **Export to Excel** in the header.

Part B — New features

B1. ID Card PDF download

Logged in as: any employee.

Sidebar → **Profile**.

Click **Download ID Card**.

Expected: a PDF downloads. Open it.

- ☐ Sized like a credit card (small)
- ☐ Org logo + name in a colored header band (using the org's brand colour)
- ☐ Your photo, OR your initials in a coloured circle if you haven't uploaded one
- ☐ Full name, employee code, designation, department, joining date

As Bilal: open `/employees/[someone-else]` → **Download ID Card** also works there for admins.

B2. Custom Schedule per employee

Logged in as: Bilal.

Open Sara's detail → **Edit**.

Scroll to **Custom Schedule** (collapsible — click to expand).

Set start time `10:00`, end time `19:00`. Pick working days Mon–Fri.

Save. Toast confirms.

Expected: when Sara logs in and checks in, late/early calculations and the off-day banner respect 10–19 instead of 09–18.

Click **Reset to policy default** → override clears.

B3. Performance notes per employee

Logged in as: Sara (manager) or Bilal (HR).

Open Hamza's detail page.

Expected: a **Performance notes** card on the page.

Type a note, tick **Private** (default on), click **Add note**. Note appears with author + timestamp.

Log in as Hamza. Open his own profile / employee detail.

Expected: the *private* note from Sara is **NOT** visible to him.

Sara posts another note with **Private** *unticked*.

Hamza refreshes — **NOW** he sees that public note.

B4. Tasks tab

Logged in as: Sara (manager).

Sidebar → **Tasks** (between Performance and Recruitment).

Click **New Task**.

Assignee: Hamza. Title: "Update CV". Description: "Send the latest by Friday." Due date: pick one.

Priority: **High**.

Save. Redirected to Tasks list.

Switch to Hamza. Sidebar → **Tasks**.

Expected: Hamza sees the task in **My tasks**. Click into it.

Click **Mark Complete**. Confirm dialog. Confirm.

Status becomes **COMPLETED**.

As Sara, switch to **Assigned by me** view → Hamza's task is now **COMPLETED**.

As Bilal: there's a third **All tasks** view where HR sees everyone's tasks.

B5. Mail tab — admin compose

Logged in as: Bilal or Super Admin.

Sidebar → **Mail**.

Recipient mode → pick **Specific employees**. Search "hamza" → tick him. Search "ali" → tick him.

Subject: "Friday update". Body: "Office closes early at 4pm."

Click **Send to 2 recipients**. Confirm dialog.

Expected: toast says "Sent to 2 of 2 recipients".

Hamza and Ali receive the email at their account email (real Gmail send via SMTP). Body wrapped in branded HTML with org name + colour.

Try again with **All employees** mode → confirm dialog should warn the larger count (~9).

B6. Suggestion box — employee submission

Logged in as: Hamza.

Sidebar → **Suggestions**.

Click **New Suggestion**.

Category: **Tools**. Title: “Slack notifications”. Body: “Could we get HRMS to send key notifications to Slack as well?”

Leave **Anonymous** unticked. Submit.

Expected: suggestion appears in your “My Suggestions” list.

Then submit a second one **with Anonymous ticked**:

Title: “Quieter break room”. Body anything. Tick **Anonymous**.

Submit.

Expected: the anonymous one does NOT appear in “My Suggestions” (because anonymous submissions have no author link).

B7. Suggestion box — admin inbox

Logged in as: Bilal.

Sidebar → **Suggestions** → **Inbox**.

Expected:

- You see both of Hamza’s suggestions.
- The non-anonymous one shows “Hamza Iqbal” as author.
- The anonymous one shows “Anonymous” — Bilal must NOT see who submitted it. (**critical privacy check**)

Click into Hamza’s named suggestion. Type a response. Click **Implement**.

Expected: status → IMPLEMENTED, response saved.

Hamza should get a notification (bell icon).

B8. Salary formula editor

Logged in as: Usman.

Sidebar → **Payroll** → **Components**.

Edit the existing **Basic** component (or create one if none exists).

Formula dropdown → **% of CTC**. Value: **60**.

Save. The list shows “**60% of CTC**” in the Formula column.

Repeat for **HRA** = 30% of Basic, **PF** = 12% of Basic (deduction).

Add a **Travel** component as **Fixed** with no percentage.

B9. Salary structure with live preview

Sidebar → **Payroll** → **Structures** → assign a structure to Hamza.

Enter **CTC** = 200,000.

Tick BASIC, HRA, PF, TRAVEL.

Expected — live preview panel:

- BASIC: PKR 120,000 (60% of CTC)
- HRA: PKR 36,000 (30% of basic)
- PF: PKR 14,400 (12% of basic, deduction)
- TRAVEL: PKR 5,000 (Fixed — typed by you)
- Net = 120,000 + 36,000 + 5,000 - 14,400 = **PKR 146,600**

Save.

B10. Auto-generate payroll from attendance

Logged in as: Usman.

Sidebar → **Payroll** → **Cycles**.

Pick a draft cycle (or create a new one for this month).

Click **Generate Payroll**.

Confirm dialog: “This will compute payslips for all active employees from their salary structures and {month} attendance. Loss-of-pay will be applied for unpaid absences.”

Confirm.

Expected: payslips are generated. Each one shows component-by-component breakdown matching the formulas. If an employee was absent any unpaid days, you see a “**Loss of Pay**” deduction line.

B11. Auto-email PDF payslips on Finalize

Logged in as: Usman.

On a cycle that already has payslips, click **Finalize**. Confirm.

Within 30 seconds: every employee receives an email titled “**Your payslip for {Month Year}**” with the PDF attached.

Open one of the emails (use Hamza’s account if you have access, or just check the api logs with the dev team).

Expected in the email:

- Subject: “Your payslip for {Month} {Year}”
- Body: “Hi {firstName}, your {Month Year} payslip is attached. Net payable: PKR ...”
- PDF attachment named `payslip-YYYY-MM-employeeCode.pdf`

PDF when opened has all amounts prefixed with “**PKR**” (no leftover dollar signs).

If an email fails for one employee (e.g. they have no email set), the others still go out — finalize doesn’t roll back.

Part C — Bug report template

For anything that didn’t behave as described, copy this:

Bug report

User: <which test account you were logged in as>

Page / URL: <e.g. /payroll/cycles/abc>

Browser: <Chrome / Safari / etc.>

What I did:

1. ...
2. ...
3. ...

What I expected:

<short description from this guide>

What actually happened:

<short description; include any error message verbatim>

Screenshot / video: <attach if possible>

Final checklist (overall sanity)

Once you've gone through the rest:

Browser tab title on every page shows the org's brand name (not "PbHub").

Every amount on every page reads as PKR.

Logout button (with text) is visible at the bottom of the sidebar.

Floating quick-actions widget works on every protected page.

Mobile: sidebar collapses, tables turn into cards, no horizontal scroll.

No console errors when you open DevTools (F12 → Console) and click around for a couple of minutes.

Thanks for testing. 🙏
